THE ANATOMY OF MAN'S BODY,

As supposed to be governed by the

Twelve constellations

ACCORDING TO ANOIENT ASTROLOGY.

The Feet, X PISCES.

To Know where the Sign is.—First find the day of the more and against it you have the sign or place of the moon, then finding the sign here, it shows the part of the body it is supposed to govern. The idea that the moon's place or the signs have any effect on the human body ought not to be believed.

ASTR(NOMCAL CALCULATIONS,

ECLIPSES FOR THE YEAR 1844.

During the year 1864 there will be but two Eclipses, both of the aua.

"The moon doth her course so wisely steer,
That she runs in sunshine all this year."

The first Eclipse will be of the san on the 5th of May, at 6 h. 25 m. P.M., he visible at Columbus, and vicinity. This Eclipse will be visible in all parts of North America west of the meridian of Houston, Texas.

The Eclipse will commence at Houston, Texas, at about sumset. It was be

annual and central in some places and total in others.

The second Eclipse will be that of the sun on the 3th Cotober, at 9 h. S9 m.
A. M., invisible at Columbus. It will be visible in Texas, and the greatmen columbus, visible in that State will be at the mouth of the Eie Grande, and at that point amount to 14 digits only.

CERONOLOGICAL CYCLES.

ASPECTS OF THE PLANETS.

Mercury will be visible in the eastern sky on the morning of February 27th about one hour before sunrise, and again in the western sky. August 17, about one hour after sunset.

Venus will be morning star till July 18th, then evening star for the remainder of the year.

. Mars will pass through opposition with the sun, Nev. 94th. He will then be nearly as bright as Venus, and can be easily distinguished by his red color.

Jupiter will be in opposition with the sun May 13th. Saturn will be in opposition with the sun April 4th.

EMBER DAYS.

February 24th, 26th, 27th; May 11th. 13th, 14th; September 21st, 28d, 24th December 14th, 16th and 17th.

THE WEATHER.

It is but just to state to the public that they kong any fuch about the woather for the coming year as we do. No Mathematician or Afrodomer, however able in his profession, can possibly "cipher out" the weather. When such predictions are seen in Almanacs, they should be regarded as more guess work, outified to ne confidence, and as likely to fail as to be true; yet, as the people seem determined to have the weather laid down, we have done our best, but you must not blame us if it does not come exactly to the day.

ANSWERS TO THE PROBLEMS FOR 1863;
Problem 1st, 26-65 feet. Prob. 2d, 90-66 feet. Prob. 3d, 2.707. Prob. 4th, 700 lbs.*
Prob. 5th, 8-640 cubic inches. Prob. 6th, 9 ft Prob. 7th, 13 ft. Prob. 8th, 23 6 ft
Prob 9th, 256 feet. Prob. 10th, 12 649 ft. Prob. 11th, 176 ft. Prob. 12th, 49 ft
Prob. 13th, 5.5 seconds. Prob. 14th, 118 ft, Prob. 15th, 3750 lbs. Prob. 16 h 5.224 ft. Prob. 17th, 1656.85 miles. Prob. 18th, 4 ft.

* Problem 4th was a misprint. It should have been printed thus: 26.65.

MATHEMATICAL ACKNOWLEDG"ENTS FOR 1863. The problems for 1863, have been ably managed by the following named Mathematicians, whose solutions are here indicated:

Mr. J E. Cartlidge, Newton, Miss.-Problems, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12.

13, 14, 15, 16, 17, 18.

Mr. Samuel F. Sauoders, Scarborough, Ga.—Problems, 1, 2 nearly, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 15, 16, 17, 18.

Mr B. F. Sitton, Gainesville, Ga.-Problems, 1, 2 nearly, 3, 4, 5, 6, 7, 8, 9, 10. 11, 12, 13, 15, 16, 17, 18.

Mr. George Manzy, Confederate Army, Richmond, Va.--Problems 1, 2, 3. 4, 5 nearly, 6, 7, 8, 9, 10, 11, 12, 13, 15, 16, 17, 18.

Mr. Wm. C. Shields, Missionary Station, Ga., -Problems, 2 nearly, 3, 7, 8, 11, 12, 13, 15, 17, 18,

Mr. E. M. Sweet, Daws Problems, 3, 5, 6, 7, 8, 9, 10, 11, 12. 13, 15, 17, 18, 16.

Mr. Abram Evans, Confederate Army, Goldsboro', N. C.—Problems, 3, 6, 7, 10, 11, 12, 13, 15 nearly, 16, 17, 18. Mr. John R. Cain, Americus, Ga.—Problems, 3, 5, 8, 11, 12, 13, 15, 16, 17, 18.

Several other persons have solved a few of the problems, but not enough to entitle their solutions to acknowledgment.

PROBLEMS FOR 1864.

The nine following Problems have been proposed by Mr. Samuel F. Saunders, Scarborough, Ga:

Proh. 1 .-- What is the length of a straight line that divides a circle 60 rods in diameter, into two parts, whose areas are as 2 to 7?

Prob. 2-Given the chord 40 and the arc 60, to find the versed sine.

Prob. 3 -In a square garden there is a spring, from which to three corners. there are 8.9 and 7 rods; how far is it from the other corner?

Prob. 4.—From a spring in a square field to the corners, are 23, 33, 27 and 13 rods. what is the area?

Prob. 5 .- If the diameter of the directing circle be 80, and the generating eircle 10, what is the area of each epicycloid?

Prob. 6. - If a circle 4 feet in diameter, roll around another circle of the same diameter; what will be the area and curve generated by a point in the circumference? Prob. 7.—The two fines that bisect the acute angles of a right angled triangle, are A and B: what are the lengths of the sides of the triangle?

Prob. 8'--In a right-angled triangle there are given the side of the inscribed

square=a, and the radius of the inscribed circle=b, to find the sides.

Prob. 9.—The diameter of a conical tree is 4 feet, its height is 90 feet; if a squirrel run spirally 45 times around it in going up, hew far will it travel?

The four following Pro blems have been proposed by Mr. J. E. Cartlidge, Newton.

Prob. 10.—What is the difference between the major and minor proportional differences of 5 and 6, and the difference of their numerical value?

Prob. 11.—What is the difference between the area of a circle whose radius is 50. yards, and its greatest inscribed square?

Prob. 12.-1 have an orchard of but 9 trees, which are set in 9 rows, with 3 in each row. Send in a diagram representing the orchard.

Prob. 13.-A. B. and C., purchase a grindstone 30 inches in diameter; A paid \$2; B \$3, and C \$4, according to agreement. A grinds off his share first, then B and C. last, how many inches in diameter must A and Beach gried off, to leave C his proportional share, making no allowance for the eye of the stone?

The following Problem has been proposed by Mr. W. C. Shields. Missionary Station, Ga.

Prob. 14.—In a circle containing just 500 acres, three other equal circles are inscribed as large as they possibly can be, touching, but not cutting each other; what is the area of each small circle, and what distance apart are their centres, and what distance is between each of their centers, and the center of the large circle, and how much land is left in the large circle, not included in the three small ones?

I propose the following Problems:

Prob. 15.--If the sun's true Longitude be L., and the Obliquity of the Ecliptic be E, what will be his Right Ascension and Declination?

Prob. 16.-When the sun's true Longitude is 60 deg. wha is the Equatior of Time? Prob. 17,-What is the difference between the sine of an arc of 1 sec. and the tangent of the same arc of 1 sec, radius being 1?

Prob. 18.—At what hour and minute will the sun rise on the 21st of June, in Lat. 50

degrees North?

Prob. 19.—When the moon's Lon. is twenty degrees, and her Lat. 3 degrees N. what is her right Ascension and Declination?

Prob. 20.—If the eccentricity of a Planet's orbit be 0. 25631; what is the greatest equation of its center, and what is the Equation when the mean Anomaly equals 20 degrees?

Prob. 21 —If the periodical time of a Primary Planet be P, and the periodical time of its Satellite be p, and if the distance of the Planet from the sun be D, and the distance of the Satellite from the Planet be d; what will be the mass of the Primary Planet, the sun's mass being 1?

Prob. 22.-When the distance of a Comet moving in a parabolic orbit, is the same from the sun as that of the Earth; with what velocity will the Comet move, the velocity of the Earth being 68,000 miles per hour. 101

Note.—Any person solving ten of the above problems, and sending to me at Americus, Ga., by the 15th of May next, the correct enswers to the same, shall have the same acknowledged in the Almanac for 1865. A few nice original Problems are deired for 1865. They must be of the higher order, and solvable only by the higher stanches of Analysis. They must be thoroughly solved and explained, in order to meet with attention. T. P. ASHMORE.

COVERNMENT OF THE CONFEDERATE STATES.

EXECUTIVE CARINET.—Jefferson Davis, of Miss., President; Alexanda H. Stephens, of Ga., Vice-President; J. P. Benjamin, of La., Secretary of State; C. G. Memminger, of S. C., Sec. Treasury; Jas. A. Beddon, of Va., Sec. War; R. S. Mallory, Sec. Navy; John H. Reagan, Postmaster Ganeral; A. T. Watts, Attorney General.

GARDEN WORK FOR 1864.

JANUARY.

To realise the sweets of summer, autumn and fall, the foundation must now be laid. Work everything in the shape of decomposing manure into the garden patch that you can lay hold on. The coarser the manure the better. Cover it under. Apply all the ashes, hen manure, &c., about your premises to the garden grounds before it is leached away and wasted. Turn it under and you have it safe. Plant out the onion, leek and garlick, and put the ground in order for February planting. Sow early varieties of English Peas during the first fortnight in January, and continue to sow a succession every week during the spring and early summer. Cabbages, Lettuce, Radishes, Salsify, Spinach, Parsnips, Beets, &c., may now be sown on ground properly prepared. Choose a warm exposure-spade, manure and pulversive your beds well, and do not plant your seed to deep. Irish Potatoes may now be planted for an early crop. Prepare all your garden implements for use this month.

FEBRUARY.

The operations of the gardener must now commence in good earnest. In order to secure a regular and abundant supply of good vegetables, the garden must be put in a thorough condition at once. Let it, however be remembered, that the soil should never be stirred, nor any seed planted while the ground is wet; in lact it must be dry enough to crumble easily when raked over.

Plant a few Melons, Squashes or Cymblins, Cucumbers, Snap-beans, &c., protecting the young plants when neceful. They may, possibly. be cut down, but to have early vegetables we must plant early, and risk the result, using what precautions we may. Plant all sorts of aromatic and pot herbs; Carrots, Parsnip produce seed—they should have been hun December. Another sowing or two of Spi 1 may be made in soil rich enough to force it, as it will quick should be sown for succession; the same v also any of the taller sorts. Sow also, Ear-, Corn, Radishes, Lettuce. Early and Summer Cabbage, and the ms n crops of Beets, Carrots, Parsnips and Salsify. Continue to set our early Cabbage plants.

and Turnips intended to) in some dry place in More Peas un to seed. eties sown last month: as

Set out the Peach, the Plum, the Apple, he Pear, the Quince, the Pomegranate, the Grape, the Strawberry, the Raspberry, and all other desirable kinds of fruit and ornamental trees and vines. Examine Peach trees for the worm, and Apple trees for the borer, and dig those depredators from their hiding places with the sharp end of your knife. Heap leached ashes around your Peach trees.

MARCH.

During a backward spring, most of the work directed to be done last month should more properly be done in March. If any early Cabbage plants yet remain in the beds, set them out the first favorable weather; the Buttersea will succeed the Early York. Okra must be got in by the middle of the month. If seed is plenty, sow in drills, four feet apart in rich ground, if scarce, drop a half dozen seed in hills three or four feet apart. When large enough, they must be thinned out to a single plant. In fact, its cultivation is precisely the same as that of Cotton.

Sow more Cabbage seed to head in the summer. Flat Dutch is the best. Thin out Turnips as soon as they have four leaves, leaving them at the distance of six inches apart, and sow more Turnip seed. White Dutch and Red Topped Dutch are the best for spring use. you did not sow Onion seed (black) last month, do it at once; they will come into use in the latter part of the summer, when all that were raised from sets or buttons are gone. If you did sow Black Onion seed in September, it can now be transplanted. Sow Carrots, Beets, Parsnips, Salsify, Lettuce, Radishes, Thyme, Parsley and Rape, (for early greens.) Plant all in rows fifteen inches apart. Sow, also, a ittle spot with Celery, and protect them from the sun. When Cherry rees are in bloom, plant Snap Beans; and when Apple trees are in lower, plant Squashes, (Scallop Squash is the best) in hills three feet spart; also Cucumbers and Muskmelons, six feet apart; the Nutmeg and Citron melons are very fine, and the earliest; Beechwood Melon s very superior, but a little later. All the vines are greatly benefited by guano or poultry manure. At the same time, also, sow Tomatoes and Egg Plants. Asparagus will now begin to sprout; don't suffer ny to run to seed, but cut all down. Cabbages which have been set out, and are starting to grow, should, once a week, have a watering of iquid manure-a shovelful of chicken manure, dissolved in ten galons of water, will be found an excellent fertilizer for them.

All vegetables, that already have a start, should have a good hoeing

y the latter part of this month.

Irish Potatoes should now be planted in drills, three feet apart, and overed with a thick layer of pine straw or leaves.

APRIL.

Attend to all work not performed last month without delay. Set ut all Cabbage plants you may have, and sow more Cabbage Seed to ead in the summer. Flat Dutch is the best. Thin out Turnips as oon as they have four leaves, and sow more turnip seed. Early Vhite Dutch and Red Topped Dutch are the best for spring use. Also DW White Norfolk Lurnip, it will grow much larger than the former nd succeed them.

Plant a full crop of English Peas for a succession. For a late crop re think the Blue Imperial and the Prussian Blue the best; when lanted at the same time as the Extra Early, they will come in three teeks later. Sow Carrots. Beets, (Extra Early is the finest,) Parsnips, alsify, Radishes, Thyme, Parsley and Rape, (for early greens.) The Vhite Belgian Carrot stands our hot summers best. Also sow Mangel Vurtzel; it will be found very good for late use, when the other eets are gone. Plant all in rows 15 inches apart. When cherry trees re in bloom, plant Snap Beans. Early Valentine is an excellent varity, and we are inclined to recommend it in preference to all others, Vhen Apple trees are in flower, plant Squashes (Scallop Squash is the est) in hills 3 feet apart; also Cucumbers and Muskmelons 6 feet part.

Common Corn and Chinese Sugar Cane, for cutting green and for interforage should also be sown plentifully during the present and le next month. Sow, also, Egyptian Millet, but do not let it come ear the Chinese Sugar Cane, or you will ruin the latter as a Sugar lant.

Sweet Potatoes.-Plant your main crop of sets and draws this month.

ry the level system. Reason and experience both teach its superior-y. But if you plant in hills and ridges, plow the soil very deep, and frow them up broad and flat on the summit, so that they may catch ad retain as much moisture as possible. Potato "draws," or any simar plants, may be safely set out. even in dry weather, by dipping the ots in a thick batter of black woods-mould or surface soil and water, wheretofore described.

The vigilant gardener will keep his eye upon the weeds. An hour's

ork now will equal a day's when the ground gets foul.

This is the month to thin out the vegetables. Thin well at first and nen go over and thin again and again. Save all the ashes, soap suds, ad hen manure about the premises, to apply to the growing crops in ne garden. Every family that keeps twenty hens, may, with the asstance of the scap suds and ashes that are generally thrown away, it tilize a garden spot in the year as much as would a ton of guano

MAY.

Do not fail to secure large beds of Drumhead, Savoy, &c., Cabbage ad Brocoli plants, sowing during showery weather. These will stand a the seed-bed until August, in the meantime the ground intended or them should be thoroughly dug or plowed and manured. Connue to set out Sweet Potato sprouts or cuttings of vines in favorable eather.

Transplant Egg Plants, and hill up Bush Beans.

Work carefully around Melons and Cucumbers, with a pronged hoe Continue to plant Okra, Squashes and Melons of the different varies, Cucumbers, Lima (or Butter) Beans, Sweet Corn. Transplant the smato, Pepper, Cabbage, Cauliflower, Celery, &c. Plant Carrots, eets, Salsify. Parsnips &c., for a succession.

Work your vegetables carefully, and be sure not to injure the roots ith the hoe. Water in dry weather, removing a portion of soil just ound the plant before watering, and replacing it afterwards to pre-

ent evaporating from the surface.

The Strawberry patch should receive a good working with pronged oes, to avoid injuring the roots. After thus loosening up the soil place the mulching and there will be little trouble with the weeds r the remainder of the season. If cultivating solely for fruit, the inners must be scrupulously kept down.

Weeds will now begin to infest your gardens, and must be ruthlessly

estroyed at their first appearance.

Destroy caterpillars' nests wherever found on your fruit trees. If e branches are crowded or overladen with thickly set fruit, thin out ie-half of it and the remainder will be enough better to pay for the ouble.

Dust over the Plum and Nectarine trees with a mixture of quick ne, ashes and sulphur while the dew is on the leaves to destroy the reulio.

JUNE.

Little can be done the present month in the garden, with the exception of alching, weeding and watering.

Irish Potatoes can be planted and heavily mulched; they will give a fair

op in October. Plant Watermelons for a succession.

JULY

Every preparation should be made for a brisk onset, next month, to insure a good fall and winter garden. The ground must be cleansed off, manured.

and well ploughed and harrowed, or dug.

By commencing very early in the morning, resting a couple of hours in the heat of the day, and working a little later, your teams and hands will account plish more than if kept constantly going.

\mathbf{AUGUST} .

A good winter garden will depend much on what is started this month therefore grudge not a little labor, in watering and mulching. Save the seeds of all earliest and best vegetables. Remember not to dry melon or cucumber seeds in the sun, it destroys their vitality; spread them in thin dishes and dry in the shade. Onions that have not yet been pulled should now be taken from the ground, dried in the shade, spread on a cool floor, or tied in bunches and hung where the air can circulate around them. Pot and medicinal herbs should now be gathered; dry in the shade and put away in proper bags for future use. Seeding weeds will now demand the gardner's attention. One root of purselane, now full of seeds, will keep a whole garden next season full of weeds. Remember the old adage, "an ounce of prevention is worth a pound of cure ''

All plants of the Cauliflower, Brocoli or Cabbage family may be set out the latter part of this month for fall and winter use. Continue to transplant Celery. Full crops of the different kinds of Turnips should be sown during the month, as directed above. Sow seeds of Beets, Salsify, Carrots, &c., or winter use—shading the ground by a slight "brush arbor," from the hot site. Radishes, Spinach, Lettuce, &c., may still be sown, and Snap Beans planted for pickles. Plant, also, Melons and Cucumbers for mangoes and pickles. Keep down all weeds—use the hoe and water freely. Plant a second or fall. erop of Irish Potatoes and Peas, mulching both heavily with leaves. The Purple Egg Plant, Tomato and Lima Bean may be planted for a late crop,

and will come yet, with "favorable seasons."

SEPTEMBER.

We can only refer to the instructions given last month, to be continued during the present one. After the first week it will not do to risk large plantations of Peas, Sweet, or other Corn, or Snap Beans. Sow Early York and other Cabbages, to be set out in January. They may require a little protection during severe weather. So of Lettuce. Sow Turnips, Mustard,

OCTOBER.

As frosts are to be expected about the last of this month, few seeds can now be sown with safety. Amongst the few that may be sown are Onions, Leeks Parsnips, Turnips, Mustard, Radishes, Early York and other spring Cab bages, in beds in which they may be protected, as also Lettuce, Cress, Celery, Parsley, &c. If any Drumhead or Savoy Cabbage, Brocoli, Endive or Lettuce plants not yet set out, attend to them first showers. Celery, planted in August, will now require to have the earth frequently stirred around it and a little earth carefully drawn around it, when dry; if wet it will rust During the first two or three earthings, the leaf stem must be held together and erect with one hand whilst the earth is pressed to them with the other Haul plenty of manure on your garden, have it well spaded, burying under all enriching animal or vegetable matter. Transplant Brocoli, Cabbages, Celery, Collards. &c. Work and manure your Asparagus bed, not forgetting to give them a liberal top dressing of salt before spring. Save all old bones, scap suds, dead leaves, decaying vegetables, &c. and make up into compost heaps for future use. Bushes of Egg Plants and Tomatoes may be taken up before frost and hung up under a shelter-they will continue to ripen the

fruit set upon them when those left in the garden are blackened and rotted by frost. November, December and January are the best month; for

planting trees, vines, &c.

CABBAGE SPROUTS.—Very few people take half the pains they ought with Cabbages. When they are cut, no matter how—the stumps are left to bring sprouts no matter when, or how many. Now, the fact is, that when the sprouts begin to come they should all be rubbed off but the best, or at most two, but if there be only one left to grow on each stump it will grow faster and better, and be occasionally as good as the first head that was cut, stead of which a multitude of small ones are allowed to grow, not any of which bring good hearts, and all are, for the most part, but a poor apology for greens. When a Cabbage is cut, the leaves should be cut off the stem and as soon as the buds of the stump begin to grow, rub off or cut all that are not wanted, leaving one of the strongest and best to grow into a head, which it will do in an incredibly short time; equalling, and most frequently excelling the first head itself in flavor and appearance This is adopted for milies more than market gardens, because there is some trouble in rubbing or taking off the useless shoots; but it is well worth while in every case NOVEMBER.

Sow Cabbages, Turnips, Parsnips. Lettuce, Carrots Radishes, &c., &c., Haul plenty of manure on your garden, have it well spaded, burying under all enriching animal or vegetable matter. Transplant Brocoli, Cabbages, Celery, "Collards," &c. Dress and manure your Asparagus beds, not forgetting to give them a liberal top-dressing of salt before spring. Save all old bones, soap-suds, dead leaves, decaying vegetables, &c. and make up into compost heaps for future use. Plough and subsoil your ground for the planting of young orchards and nurseries, and provide a supply of roots and stocks for the propagation of all new and desirable varieties of fruit adapted to our southern climate.

In transplanting trees, before taking up, mark the side that was at the morth so as to place it in the same position. If all would give strict orders to mark the north side of trees with chalk before they were taken up, and when set out to have the tree put in the ground with the north side to the north in its natural position a larger proportion would live. Ignoring this law of nature is the cause of so many transplanted trees dying. If the north side is exposed to the south, the heat of the sun is too great for that side of the tree to beat and therefore it dries up and decays.

DÉCEMBER.

But little can be done in gardening. In pleasant days manure, spade and prepare the ground for the spring planting. Seed sown now

are as good as thrown away.

The cattle demand our constant care during this inclement season: and their appearance is no bad index of the character of their owner. Does not a lean, half starved, unsheltered cow convict her owner of inhumanity? Dry. warm stables are matters of prime importance for horses and neat cattle. If the barn is not already tight it should be made so before extreme cold weather sets in. A few dollars laid out supon boards and shingles in stopping crevices will be much better economy than in buying extra food. Combirtable stabling will make a difference of five dollars in the expense of wintering a cow. A tight barn saves one-fourth of the fodder. A cow is often left to seek shelter behind a fence and is nearly frozen in the sleet which is forming a cake of ice upon her hide. In the morning she comes up shivering and nearly dead to get a little fodder, and is expected to give a good One cow properly treated will give more milk than lot of milk. half a dozen uncared for.

JAS. McPHERSON & G. BOOK-SELLERS:
